

The Arkansas
Assessment of
Childhood and
Adolescent Obesity
– Tracking Progress

ONLINE STATE REPORT

Year 3 (Fall 2005–Spring 2006)

Acknowledgments

ACHI recognizes and thanks the dedicated and hardworking school personnel—nurses, teachers, PE instructors, principals, superintendents, clinicians, and others—who recognize the importance of continuing this ground-breaking work in combating childhood and adolescent obesity. In particular, we applaud the vision of school administrators who encouraged nurses to be trained in the pilot web-based system and we thank those nurses for agreeing to learn a new task while continuing to carry out their daily work.

ACHI also gratefully acknowledges the Robert Wood Johnson Foundation for its financial support of the BMI data analysis.

Overview and Highlights of the Arkansas BMI Assessments

Analysis of the third annual BMI assessments of public school students reveals that the progression of the childhood obesity epidemic has been halted in Arkansas. Despite these results, almost 38 percent of children and adolescents in the state continue to face an obesity problem and associated health risks.

Childhood obesity is a leading public health threat in the United States. More than 9 million children over the age of six are affected by the obesity epidemic, with minorities and children living in low-income communities facing the greatest risk. Obese children face an increased risk of developing hypertension, diabetes, heart disease, and other life-threatening illnesses as they age. If the epidemic grows unchecked, obesity-related illnesses may cause today's young people—for the first time in U.S. history—to have a lower life expectancy than their parents' generation.

Arkansas leaders recognized the danger of the obesity epidemic and took aggressive action long before many states had focused on the problem. Three years ago, Arkansas passed Act 1220 of 2003, a uniquely comprehensive approach to combating childhood obesity in public schools and local communities. Among other provisions, the Act called for improved access to healthier foods in schools, creation of local committees to promote physical activity and nutrition, and confidential reporting of each student's body mass index (BMI) to his or her parents.

To help implement Act 1220 and gauge its effectiveness over time, the Arkansas Center for Health Improvement (ACHI) worked with Arkansas policymakers and school personnel to develop a system for weighing and measuring students, calculating BMI levels, and collecting and analyzing data on a school, school district, and statewide basis.

As a result of its size and methodological rigor, ACHI's BMI database provides the broadest and most precise single-state profile of the childhood obesity epidemic in the nation.

As a result of its size and methodological rigor, ACHI's BMI database provides the broadest and most precise single-state profile of the childhood obesity epidemic in the nation.

Building on new actions by the Arkansas State Board of Education, ACHI worked closely with public school personnel and community health nurses during the last school year to improve and streamline the BMI assessment and reporting process. A new web-based data entry system was used to assess BMIs for about one-fourth of public school students, or 130,000 individuals, during the 2005–2006 school

year. Overall, BMI assessment forms were completed for nearly 434,000 Arkansas public school students in 2005–2006.

Researchers at ACHI analyzed the results of three consecutive years of BMI screenings for Arkansas public school students. The data reveal that the percentage of students classified as overweight decreased from 20.9 percent during the first year to 20.4 percent this year. It also shows that the percentage of students at risk for overweight—the category between “healthy weight” and “overweight”—declined slightly over the same period from 17.2 percent to 17.1 percent. Although obesity among children and adolescents remains a major public health threat with almost 38 percent of Arkansas students categorized as at risk for overweight or overweight, it's clear that Arkansas's efforts are yielding positive results for the state's children and families.

BMI Data Collection Efforts

Process

Since Arkansas began collecting BMI data in the 2003–2004 school year, ACHI has worked closely with public school personnel and community health nurses to develop and subsequently improve and streamline the BMI assessment and reporting process.

The success of and positive response to last year's small pilot of new web-based technology encouraged ACHI to expand a web-based data entry system to 16 school districts (216 schools) during the 2005–2006 school year (Table 1). This new web-based data entry system allowed data to be collected in a streamlined paperless fashion. Approximately 130,000 students, or one-fourth of the Arkansas student population, were assessed using the web-based system in 2005–2006.

Working with the Arkansas Educational Cooperatives, which gave school personnel and ACHI staff access to computer labs and IT specialists, participating school districts' personnel completed training on the web-based system by January 2006. Pilot schools entered student BMI data into computers with Internet connectivity either from paper records kept while weighing and measuring students or by directly entering data into the web-based system at the time of assessments. The web-based system enabled schools to immediately generate individual, confidential Child Health Reports for parents after data were entered.

Nurses using the web-based system evaluated it and provided valuable feedback to ACHI. Most participants noted how easy the system was to use and enjoyed being able to retrieve reports quickly. There is also a strong desire on the part of school

health staff to merge future BMI reports with other health assessments, such as vision, hearing, and other screenings.

Districts that did not participate in pilot tests of the web-based data entry system received student labels

in September 2005 so the assessment process could begin early in the school year. Student data were collected by school nurses and other school personnel. Paper records were sent to the University of Arkansas at Fayetteville's Survey Research Center for data entry. School personnel were then able to print confidential reports for parents by accessing ACHI's secure website.

ACHI intends to expand the web-based entry system to all districts in the 2006–2007 school year. Training sessions for Community Health Nurses will be scheduled during the 2006–2007 school year with assistance from the Educational Cooperatives. Community Health Nurses will then be able to train

school personnel, who will begin data collection at their convenience and enter data into a pre-populated system. This cost-effective method of collection only requires schools to have Internet connectivity; they do not have to purchase software or to print assessment forms or student labels. No longer will schools have to package and ship forms to a data entry center or wait for reports to be created. Schools will be able to weigh and measure students, enter the data directly into the web-based program, and print off reports immediately. Information about the process will be available on ACHI's website at www.achi.net.

Definition of BMI

The BMI is a ratio of weight and height, and is a better assessment of obesity than weight alone. Using an accurate weight and height, BMI is calculated using the following formula:

$$\text{BMI} = \frac{\text{Weight in pounds}}{(\text{Height in inches})^2} \times 703$$

Boys and girls grow and develop at different rates. Based upon Centers for Disease Control and Prevention (CDC) recommendations, a BMI percentile for children is calculated individually for each boy and girl based upon his or her gender, age, height, and weight. BMI percentiles are then used to categorize children according to whether they are underweight, healthy weight, at risk for overweight, or overweight. (CDC does not use the term “obese” when referring to children.) A higher BMI indicates greater risk for having or developing obesity-related health problems. Health care professionals group BMI percentiles to identify underweight and overweight children as follows.

- **Overweight:** BMI-for-age greater than or equal to 95th percentile
- **At risk for overweight:** BMI-for-age between 85th and less than 95th percentiles
- **Healthy weight:** BMI-for-age between 5th and less than 85th percentiles
- **Underweight:** BMI-for-age less than 5th percentile

A BMI assessment is only a screening tool and an individual child’s BMI should not be considered a final indicator of whether or not a child has a weight problem that requires attention. Further evaluation by a health professional is the recommended next step for a child who is classified as at risk for overweight or overweight. However, BMI is a standard screening tool used to assess the risk of childhood obesity. In a 2003 policy statement, the American Academy of Pediatrics recommended that every child every year have his or her BMI assessed. The Institute of Medicine in its 2005 report also recommended that schools conduct annual BMI assessments and make this information available to parents.

Aggregate child BMI assessments presented in this report are an excellent indication of the extent of the current problem of childhood and adolescent obesity in Arkansas schools, school districts, and the state. The data presented in this report serve as a warning about the potential future health problems that Arkansans may face as these children become adults.

Student and School Participation in the BMI Initiative

In the 2005–2006 school year, 99 percent (1,090 of 1,106) of Arkansas public schools in 257 of 261 school districts participated in BMI assessments. Schools submitted BMI assessment forms for 90 percent (433,808) of students enrolled in Arkansas public schools. Among students for whom data was reported, 86 percent (371,082) had appropriate data to allow BMI calculation.

Table 2. Statewide Participation in BMI Assessments

| Category | Year 1 ('03-'04) | | Year 2 ('04-'05) | | Year 3 ('05-'06) | |
|--------------------|------------------|---------|------------------|---------|------------------|---------|
| | Percent | Total | Percent | Total | Percent | Total |
| Participation* | | | | | | |
| Public schools | 94.3% | 1,060 | 98.7% | 1,115 | 98.6% | 1,090 |
| Students (PK–12) | 92.6% | 426,555 | 95.1% | 447,712 | 90.2% | 433,808 |
| Student Data | | | | | | |
| Valid for analysis | 81.8% | 348,710 | 83.2% | 372,369 | 85.5% | 371,082 |
| Invalid | 1.4% | 5,937 | 1.1% | 4,784 | 0.4% | 1,568 |
| Unable to assess | 16.9% | 71,908 | 15.8% | 70,559 | 14.1% | 61,158 |

*Results include all data available for years 1 and 2 and data received by June 14, 2006 for year 3 analysis. Some public schools and districts merged after year 1 and year 2.

Data Collected and Reasons Students Could Not Be Assessed

To complete the BMI assessments, schools reported each student's name, address, grade, gender, ethnicity, and birth date along with his/her height and weight and measurements.

Approximately one in seven students (61,158) could not have their BMIs calculated, usually because they were absent on the day of assessment. Other reasons that students were classified as "unable to assess" include physical disability, student or parent refusal to participate, and inability to obtain accurate measurements. Less than one percent (1,568) of students who participated in the assessment process had "invalid" data, meaning that the information reported could not be used to calculate a BMI.

Among the students in grades K–12, there was little difference between the number of males and females who could not be assessed, with the exception of more parent and student refusals among females (57 percent) than males (43 percent).

There were slight variations by ethnic groups among those who were and were not assessed. Of the students who did have a BMI calculated, 67 percent were white,

23 percent were African American, 7 percent were Hispanic, and 3 percent were classified as "other". Of the non-assessed students, 72 percent were white, 19 percent were African American, 7 percent were Hispanic, and 2 percent were classified as "other".

Similar to last year, the largest difference found in percentage of students assessed was by grade. Approximately 23 percent of high school students (grades 9–12), 13 percent of middle school students (grades 6–8), and 10 percent of kindergarten/elementary students (K–5) were not able to be assessed for BMI.

Among the approximately 61,000 students (14 percent of total participants) who were not assessed for BMI, absenteeism accounted for 44 percent of those not assessed in high schools, 50 percent in middle schools, and 51 percent in elementary schools. Student refusal accounted for 34 percent of those not assessed in high schools, 15 percent in middle schools, and 2 percent in elementary schools while parental refusal accounted for 12 percent of those not assessed in high schools, 27 percent in middle schools, and 38 percent in elementary schools.

Figure 1. Reasons Students Could Not Be Assessed (2005–2006)

Reasons Students Could Not Be Assessed

| | |
|--|-------|
| Absent | 6.74% |
| Parent refused | 3.33% |
| Student refused | 2.72% |
| Other | 0.62% |
| Not enrolled at school | 0.40% |
| Disability prohibited measurement | 0.21% |
| Pregnant | 0.07% |
| Unable to obtain accurate measurements | 0.01% |

Special Circumstances for Reporting

The results section of this report includes statewide BMI percentages of underweight, healthy weight, at risk for overweight, and overweight students for selected demographic subgroups. Percentages for these four classifications are also reported for the majority of districts and counties in the state (see Appendices). However, to protect private health information (based on rules in the federal Health Insurance Portability and Accountability Act of 1996) and in compliance with common statistical reporting practices, if less than five students are in a particular classification, then that group is either not reported or is combined with another group. For example, if fewer than five

students are in the underweight category, this category is combined with the healthy weight group. Similarly, for some schools with less than five students in the overweight or at risk for overweight classifications, these two groups are combined.

Due to the large number of students assessed, results by gender, ethnic groups, and grade were included in this report that are not available from any other source in the nation. Gender and grade were available for virtually every student in the system. Information on ethnicity was missing for 1 percent of the students assessed.

For the last two years, an investigative team at the College of Public Health at the University of Arkansas for Medical Sciences (COPH) has published an evaluation of Act 1220 activities—the third-year evaluation is expected in early 2007. The second-year report indicates that parents and adolescents are generally comfortable with the BMI assessment and reporting process. The evaluation also noted that no negative outcomes were found to be associated with the BMI assessment and reporting process.

(Year Two Evaluation: Arkansas Act 1220 of 2003 to Combat Childhood Obesity. Little Rock, AR: Fay W. Boozman College of Public Health, University of Arkansas for Medical Sciences, January 2006. Available at www.uams.edu/coph/reports.)

Child Health Reports

Confidential Child Health Reports were generated and were made available through schools for each student's parent or guardian. The reports explained why Arkansas assesses students' BMI levels, described the BMI screening process, educated parents about potential obesity-related health risks facing their children, and provided simple suggestions to help families improve nutrition and increase physical activity. Depending on the student's information, the report included the student's height, weight, and BMI and a classification as underweight, healthy weight, at risk for overweight, overweight, or unable to assess. In addition, these five types of reports were translated into Spanish for those students whose records indicated that Spanish was the primary language spoken at home. Sample Child Health Reports are available on the ACHI website at www.achi.net.

School Reports

Results for each school that reported data to ACHI are included in school-level profiles. These reports, which were made available to schools and on ACHI's website (www.achi.net), describe the extent to which the school is being affected by the obesity epidemic. BMI is defined, and the formula used and student classifications

based on BMI percentile rankings are explained. BMI classifications for the school are presented for male and female students by grade and collectively for all students. Results for BMI classifications of students in individual schools in Arkansas are presented in Appendix A.

School District Reports

School district reports combine information from all available school data in that district. Summary statistics for each school within the district and overall results for the district provide a community assessment of the environmental impact of obesity on public school students. Additional information, similar to that included in the school report, is depicted using both tables and charts. (School district reports are available at www.achi.net.) Results for BMI classifications of students in individual school districts in Arkansas are presented in Appendix B.

Statewide Report

In this statewide report, results are presented for all students with a valid BMI. Additionally, results are presented by various demographic characteristics, including gender, ethnic group, and grade. Overall BMI classifications for students by county are shown in Appendix C.

Statewide Results of the Arkansas BMI Assessments

Data from three consecutive years of BMI screenings reveal that the percentage of students classified in the two highest risk categories (overweight and at risk for overweight) decreased from 38.1 percent during the first year to 37.5 percent this year.

Table 3. Trends in BMI Classifications for Arkansas Public School Students

| Category | Year 1 ('03-'04) | Year 2 ('04-'05) | Year 3 ('05-'06) |
|--------------------------|------------------|------------------|------------------|
| Overweight | 20.9% | 20.8% | 20.4% |
| At risk for overweight | 17.2% | 17.2% | 17.1% |
| Healthy weight | 60.1% | 60.1% | 60.6% |
| Underweight | 1.8% | 1.9% | 1.9% |
| Total students assessed* | 348,710 | 372,369 | 371,082 |

*Results presented include all data for years 1 and 2 and data received by June 14, 2006 for year 3 analysis.

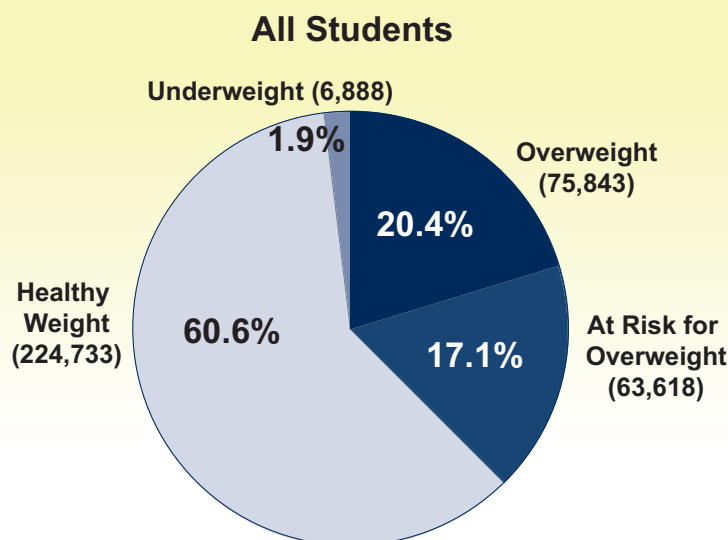

Overall State Results for 2005–2006

The total public school enrollment for the 2005–2006 school year, reported by the Arkansas Department of Education, was 480,811 students enrolled in 1,106 schools within 261 school districts. Statewide results presented in this section of the report are based on data from 371,082 individual students with valid BMI assessments that were reported prior to June 14, 2006 by 1,090 schools in 257 school districts.

BMI Classifications for All Students

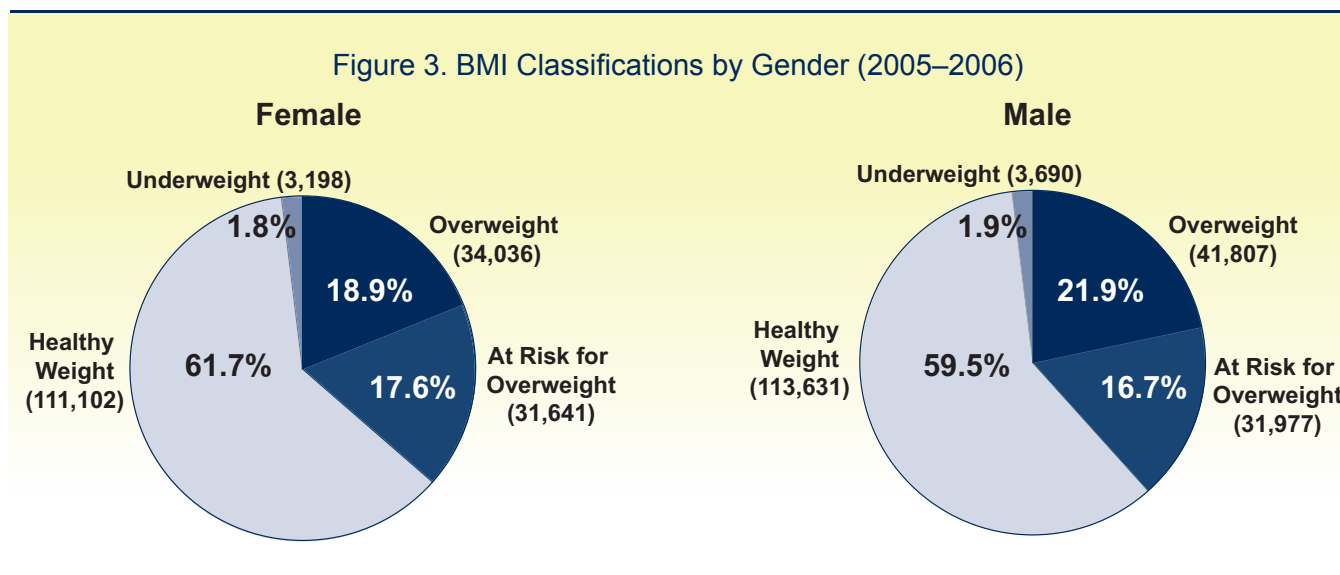

Among public school students in Arkansas, 20 percent met the Centers for Disease Control and Prevention criteria for being overweight, 17 percent were at risk for overweight, 61 percent were healthy weight, and 2 percent were underweight. Despite a slight decline in the percentage of students who were overweight and at risk for overweight during the past three years, 37.5 percent of children and adolescents statewide still have a potential obesity problem and face health risks associated with being overweight.

Figure 2. BMI Classifications for Arkansas Public School Students (2005–2006)

BMI Classifications by Gender

More males (39 percent overall) than females (37 percent overall) were overweight or at risk for overweight. Among those identified as overweight, the percentage among males (22 percent) was higher than the percentage among females (19 percent). The percentage underweight was similar for both genders (2 percent).

BMI Classifications by Ethnic Group

Hispanic students were more likely to be overweight or at risk for overweight compared with whites or African Americans, with 46 percent of Hispanic students classified as either overweight or at risk for overweight. Among African-American students, 41 percent were in the two highest risk categories, while 36 percent of white students fell in that range. Whites had the highest percentage of students classified as underweight at 2 percent.

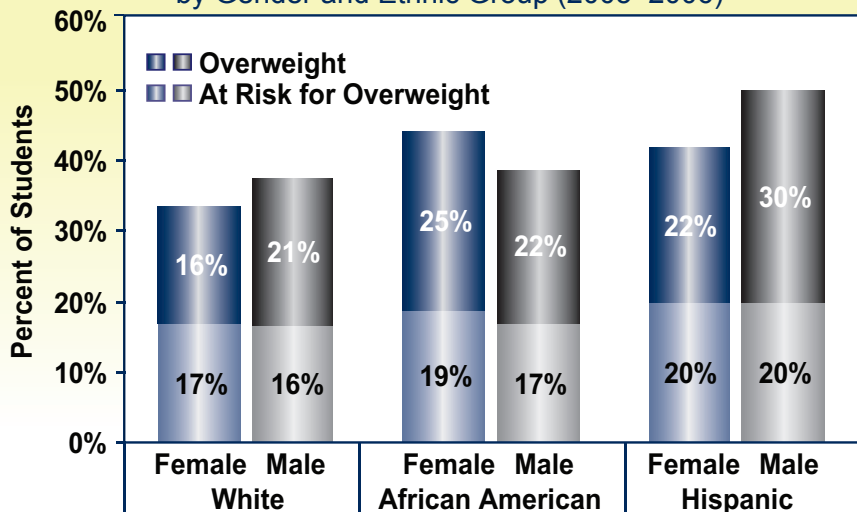

Table 4. BMI Classifications by Ethnic Group (2005–2006)

| Category | White | | African American | | Hispanic | |
|------------------------|---------|---------|------------------|--------|----------|--------|
| | Percent | N | Percent | N | Percent | N |
| Overweight | 18.9% | 46,894 | 23.5% | 20,233 | 26.4% | 6,734 |
| At risk for overweight | 16.7% | 41,397 | 17.8% | 15,310 | 19.8% | 5,041 |
| Healthy weight | 62.4% | 154,681 | 57.3% | 49,313 | 52.6% | 13,419 |
| Underweight | 2.0% | 5,056 | 1.5% | 1,264 | 1.2% | 302 |

BMI Classifications by Gender and Ethnic Group

Hispanic males and African-American females had the highest obesity risks when evaluating results by race and gender. Half (50 percent) of Hispanic males were classified as overweight or at risk for overweight and 44 percent of African-American females were overweight or at risk for overweight. The obesity risk was similar among white and African-American males (37 percent and 39 percent, respectively). With 42 percent of Hispanic females being in the two highest risk groups, their rates were almost as high as African-American females, while 33 percent of white females were overweight or at risk for overweight.

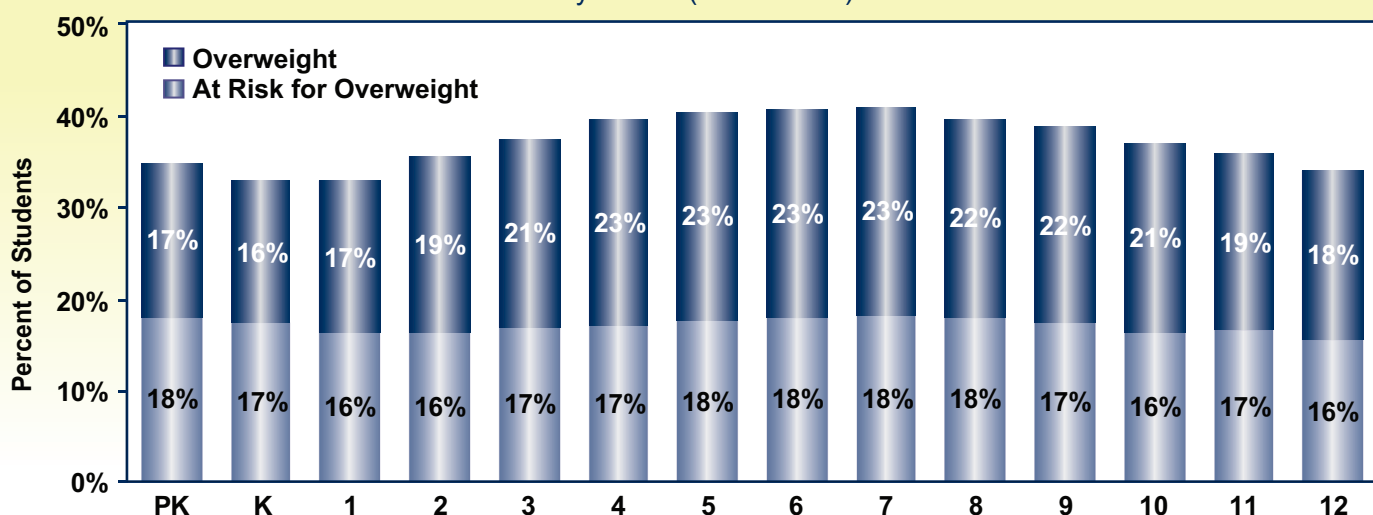

Figure 4. Percentage of Students Classified as Overweight or At Risk for Overweight by Gender and Ethnic Group (2005–2006)

BMI Classifications by Grade

The percentage of students who were overweight or at risk for overweight increased during elementary school years and peaked during the middle school years (5th through 7th grade). At least 40 percent of students in grades 4 through 8 were classified as overweight or at risk for overweight. The prevalence of obesity diminishes slightly during the high school years, dropping to 34 percent by grade 12; however, 23 percent of high school students were not assessed for BMI.

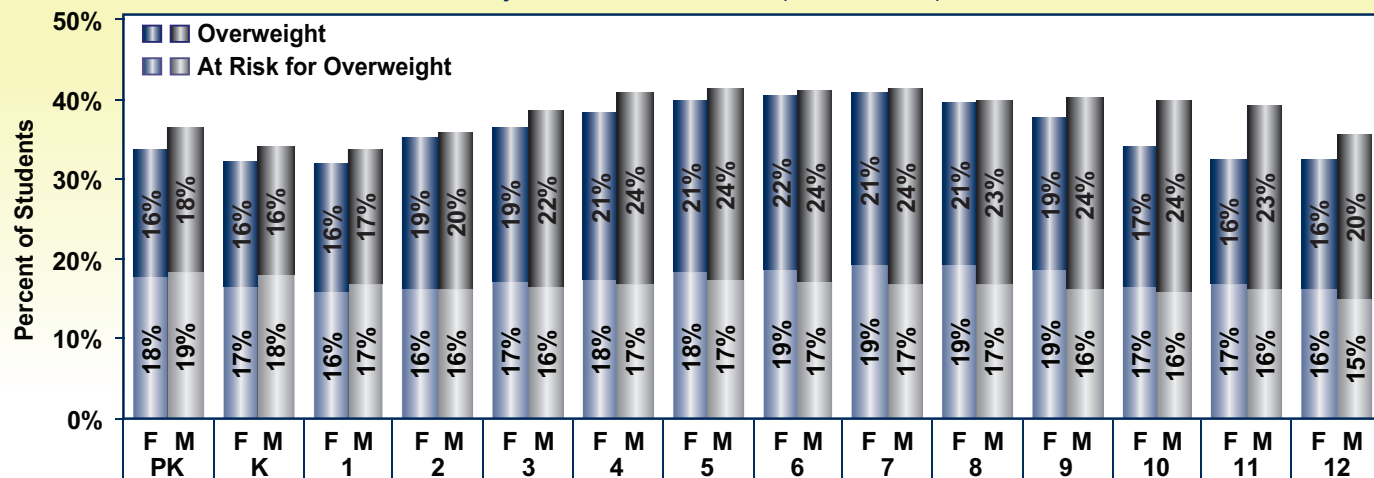

Figure 5. Percentage of Students Classified as Overweight or At Risk for Overweight by Grade (2005–2006)

BMI Classifications by Gender and Grade

Across most grades, a greater percentage of males than females were classified as overweight or at risk for overweight. In the middle school years, the difference between percentage of male and female students identified as overweight or at risk for overweight is small; however, in high school this difference becomes more pronounced.

Figure 6. Percentage of Students Classified as Overweight or At Risk for Overweight by Gender and Grade (2005–2006)

BMI Classifications by Gender, Ethnicity, and Grade

Analysis of the BMI assessments shows that some groups face a heightened risk for childhood obesity. The highest obesity rates were found among Hispanic males and African–American females. More than half (53 percent to 56 percent) of Hispanic males in grades 3 through 7 were classified as overweight or at risk for overweight, and nearly half (48 percent to 49 percent) of African–American females in grades 5 through 9 were overweight or at risk for overweight. The lowest obesity rates for females were found among high school students classified as white or other. For males, the lowest rates were among elementary students classified as white or other.

Figure 7. Percentage of Students Classified as Overweight or At Risk for Overweight by Gender, Ethnicity, and Grade (2005–2006)*

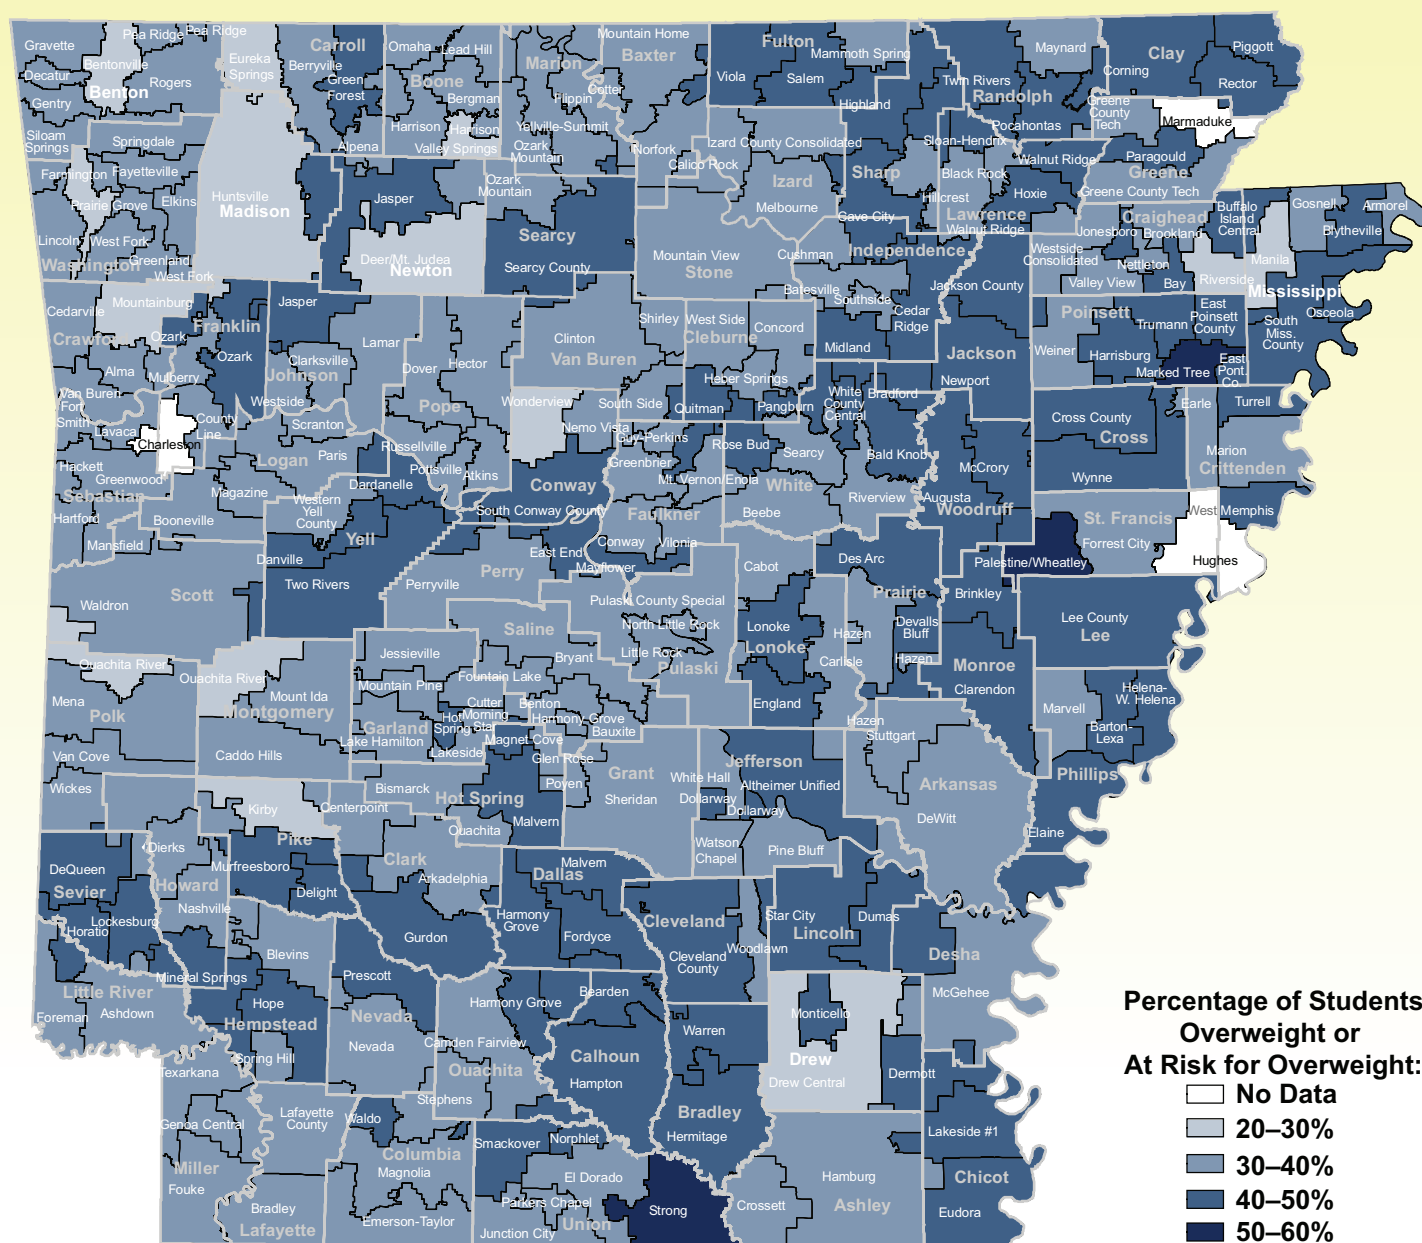

School District Results

Childhood and adolescent obesity is a problem in every county in Arkansas. Among 261 school districts in the state, 257 had reported data by June 14, 2006. The percentage of students within a school district who were overweight or at risk for overweight is shown in the map (Figure 8). The map is shaded according to the magnitude of the percentage. The lightest shade represents the districts with the lowest percentage (20–30 percent) and the darkest shade represents those with the highest percentage (50–60 percent) of students classified as overweight or at risk for overweight. As noted below the map, of 13 school districts that fall within the lowest range for percentage of students classified as overweight or at risk for overweight, one submitted BMI assessments for less than one-third of its students and eight districts submitted assessments for less than two-thirds of their students. Therefore, the map may not reflect accurate results for some of these school districts. (See Appendix D for a map showing the student participation in BMI assessments by school district.)

Among the districts reporting results, 14 school districts had 20 to 30 percent of their students classified as overweight or at risk for overweight, 149 school districts had rates of more than 30 to 40 percent, 90 school districts had rates of more than 40 to 50 percent, and 4 school districts had 50 percent or more of their students in the two highest risk categories. (Note that nine districts including those with special school classifications are not displayed on the map in Figure 8 because of their small geographic size.)

Figure 8. Percentage of Students Classified as Overweight or At Risk for Overweight by Arkansas Public School District (2005–2006)

Sources: Arkansas Center for Health Improvement, Arkansas Department of Education, and Census 2002 TIGER Lines Files.

Notes: Results are reported for 257 of 261 Arkansas school districts. Of the 13 school districts included on the map that fall within the lowest range for percentage of students classified as overweight or at risk for overweight, Manila School District submitted BMI assessments for less than one-third of its students, and Eureka Springs, Prairie Grove, Deer/Mt. Judea, Valley Springs, Ouachita River, Huntsville, Kirby, and Riverside school districts each submitted assessments for less than two-thirds of their students. Therefore, the map may not reflect accurate results for some of these school districts. The other four districts in the lowest range submitted BMI assessments for more than two-thirds of their students. Three districts that did not report data are shown in white. One other district (Academics Plus School District) that did not report data is too small to be seen on the map. Eight other school districts that have special school classifications are not displayed on the map (e.g., Arkansas School for the Blind) because of small geographic district size.

Conclusion—Comprehensive Efforts Yield Results

The Arkansas experience shows that a comprehensive and collaborative effort by legislators, state health officials, educators, clinicians, parents, and community members can make a meaningful difference. It also highlights the value of BMI reporting as part of a statewide program to promote awareness of the obesity crisis, the related health problems, and the importance of nutrition and physical activity. ACHI hopes these conclusions will inform future policy efforts in Arkansas and throughout the nation.

While halting the rise of childhood and adolescent obesity is a tremendous achievement, ACHI recognizes that reversing the epidemic will require the continued intervention of state leaders. ACHI hopes to continue to track progress in ways that will help Arkansas and states across the nation refine their efforts to reverse the epidemic and improve the health of our children and families.

Appendix A

BMI Classifications by School (2005–2006)

| School District | District LEA | School | School LEA | Under-weight | Healthy Weight | At Risk for Overweight | Overweight | At Risk for Overweight or Overweight |
|--------------------|--------------|---------------------------------------|------------|--------------|----------------|------------------------|------------|--------------------------------------|

Student BMI Assessment Rates (2005–2006)

Student assessment rates varied from 28 percent to 97 percent of student enrollment. High participation rates allow confidence in the results reported by schools and school districts. For those schools or school districts with low participation rates, under-reporting of select categories is possible.

Sources: Arkansas Center for Health Improvement, Arkansas Department of Education, and Census 2002 TIGER Lines Files.

Notes: Results are reported for 257 of 261 Arkansas school districts. Three districts that did not report data are shown in white. One other district (Academics Plus School District) that did not report data is too small to be seen on the map. Eight other school districts that have special school classifications are not displayed on the map (e.g., Arkansas School for the Blind) because of small geographic district size.

The Arkansas Center for Health Improvement (ACHI) was formed in 1998 as an innovative solution to the health crisis faced by Arkansas—a solution that is producing results. Data show that Arkansans consistently fall below national health standards—they have low rates of health insurance, lack access to quality health care, and face racial health disparities. Many adults and children also have unhealthy lifestyles and behaviors that significantly contribute to the crisis. Today, the environment in Arkansas is changing to support and promote health.

ACHI is a nonpartisan, independent, health policy center. Its mission is to serve as a catalyst for improving the health of Arkansans through evidenced-based research, public issue advocacy, and collaborative program development. ACHI is jointly supported by the University of Arkansas for Medical Sciences, the Arkansas Department of Health and Human Services, and Arkansas BlueCross BlueShield.

ACHI believes that Arkansans' poor health status will not improve until root causes are addressed and health policies and initiatives that alter behaviors and measurably improve health are established statewide. The Center's staff work with public- and private-sector partners to be a catalyst for improving the health of Arkansans.

As a trusted health policy leader, ACHI has received both state and national recognition for its efforts to inform debate, spark dialogue, and develop strategies that advance the health and productivity of Arkansas residents.
